

CYBERTECH CLUB @ PSU | CTF WORKSHOP SERIES  
MODULE 01

# Recon & Web Proxies

Participant Handout • Spring 2026

## HOW TO USE THIS HANDOUT

This packet mirrors the live workshop deck and gives you everything needed to study the material async. Each section maps to a slide in the deck.

## 1. Hook

### SET THE SCENE

**Before any hacker attacks a system, they first gather information quietly.**

Using tools like web proxies, they can see and manipulate every request your browser sends without you noticing.

## 2. Learning Objectives

*By the end of this topic, a student can:*

- Identify reconnaissance techniques used in web security.
- Use a web proxy to intercept and analyze HTTP requests.
- Modify requests to test web application behavior.

## 3. Core Concept

### Reconnaissance (Recon)

The process of gathering information about a target before launching an attack. In web security, this includes identifying endpoints, parameters, technologies, and hidden functionalities.

### Web Proxy

A middleman between the browser and the server. A web proxy lets attackers or testers intercept, inspect, and modify HTTP and HTTPS requests and responses. Burp Suite is the standard tool for this in the security industry.

### Why it matters

Once you can see every request your browser sends, you can change parameters, replay calls, and probe for weak points. A proxy turns a black-box web app into a transparent one.

FIGURE 1: AN INTERCEPTED HTTP REQUEST

```
1 GET / HTTP/1.1
2 Host: example.com
3 User-Agent: Mozilla/5.0 (X11; Linux x86_64)
4 Accept: text/html,application/xhtml+xml
5 Accept-Language: en-US,en;q=0.5
6 Accept-Encoding: gzip, deflate, br
7 Connection: keep-alive
8 Upgrade-Insecure-Requests: 1
```

*Captured in Burp Suite under Proxy → Intercept. Every header and parameter the browser would have sent is visible here, and editable before the request reaches the server.*

## 4. How It Works

The workflow below is the same pattern a pen tester follows on every new engagement.

STEP

01

### Perform Reconnaissance

*Map the target before you touch it.*

- Identify the website structure (pages, admin areas, APIs).
- Discover endpoints (public routes, hidden ones, legacy URLs).
- Collect information about the stack, technologies, and versions.

STEP

02

### Configure Web Proxy

*Point your browser at Burp.*

- Install Burp Suite (Community Edition is fine for the workshop).
- Set the browser proxy to 127.0.0.1:8080.
- Enable interception in the Proxy tab.

STEP

03

### Intercept Requests

*See exactly what the browser sends.*

- Capture HTTP requests as the browser makes them.
- View headers, parameters, cookies, and body.

STEP

04

### Modify Requests

*Change the request before the server sees it.*

- Change parameters (usernames, IDs, flags, pagination values).
- Replay the request to see how the server responds to variants.

STEP

05

### Identify Weak Points

*Look for where the app breaks.*

- Look for vulnerabilities: IDOR, auth bypass, input validation gaps.

## 5. Demo Walkthrough

Run this end to end on your own machine after the workshop. The live demo follows the same script.

### Prerequisites

TOOL	BROWSER	TARGET
Burp Suite	Chrome or Firefox	http://example.com

### Step 1: Start Burp Suite

**Action.** Open Burp Suite and start a Temporary Project.

**Expected.** Proxy listener running on 127.0.0.1:8080.

### Step 2: Configure browser proxy

**Action.** Set the browser proxy to 127.0.0.1:8080.

**Expected.** Traffic appears in Proxy → HTTP history.

### Step 3: Intercept a request

**Action.** Turn “Intercept is ON” and open http://example.com.

**Expected.** Request appears in the Intercept tab.

### Step 4: Modify the request

**Action.** Edit the request before forwarding (change the path or a parameter). Example: change the path to /admin.

**Expected.** The server responds differently (access denied, different page, or an error).

### Example modified request

```
1 GET /admin HTTP/1.1
2 Host: example.com
```

### Fallback if the live demo fails

- Screenshot of the intercepted HTTP request in Burp Suite (Proxy → Intercept tab), showing request headers and parameters.

- Screenshot of HTTP history (Proxy → HTTP history) demonstrating captured traffic between browser and server.

## 6. Common Pitfalls

*When something does not work, check these first before asking for help.*

### SYMPTOM

#### No traffic in Burp Suite

**Cause:** Browser proxy is not configured correctly.

**Fix:** Set proxy to 127.0.0.1:8080 in browser settings.

### SYMPTOM

#### HTTPS websites do not load

**Cause:** Burp certificate is not installed.

**Fix:** Install and trust the Burp CA certificate in the browser.

### SYMPTOM

#### Requests are not being intercepted

**Cause:** Intercept option is turned off.

**Fix:** Turn "Intercept is ON" in Burp Suite.

### SYMPTOM

#### Modified request has no effect

**Cause:** Incorrect parameter or format.

**Fix:** Double-check parameter names and values before sending.

## 7. Your Challenge

15 – 20 MIN

BEGINNER

### THE TASK

**Use Burp Suite to intercept a login request from a website and modify the username or a parameter before sending it to the server.**

### SUCCESS CRITERION

Submit a screenshot showing the intercepted request and the modified response from the server.

### Hints

1. Make sure interception is turned on.
2. Look for POST requests when logging in.
3. Modify a parameter before clicking Forward.

## 8. Cheatsheet

Keep this page next to you while you practice. Commands, payloads, and shortcuts only, no prose.

COMMAND / PAYLOAD	WHAT IT DOES	WHEN TO USE
<b>Intercept ON</b>	Stops the request before it is sent to the server.	When you want to modify a request.
<b>Forward</b>	Sends the request (modified or not) to the server.	To continue the normal flow.
<b>Repeater</b>	Resend and test a request with variations.	Testing changes without re-triggering the browser.
<b>HTTP History</b>	Shows all traffic that has passed through Burp.	Analysis and finding past requests.
<b>127.0.0.1:8080</b>	The default Burp proxy listener address.	Configure this in the browser proxy settings.

### Sample HTTP request (memorize the shape)

```
1 GET / HTTP/1.1
2 Host: example.com
3 User-Agent: Mozilla/5.0 (X11; Linux x86_64)
4 Accept: text/html,application/xhtml+xml
5 Accept-Language: en-US,en;q=0.5
6 Accept-Encoding: gzip, deflate
7 Connection: keep-alive
8 Upgrade-Insecure-Requests: 1
```

---

## 9. Further Reading

Go deeper on your own time with these three resources.

**01**

### OWASP Web Security Testing Guide

Official, detailed methodologies for testing web application security, including reconnaissance techniques.

<https://owasp.org/www-project-web-security-testing-guide/>

**02**

### Burp Suite Documentation

Official guide explaining how to use Burp Suite features like proxy, intercept, repeater, and request analysis.

<https://portswigger.net/burp/documentation>

**03**

### PortSwigger Web Security Academy

Interactive labs and real-world scenarios to practice web proxy usage and web security testing skills.
